

Data Diagnostics® patient data analytics

More time engaging patients, less time looking for data

Data Diagnostics aggregates patient data from outside your EHR to work with your existing patient data to support clinicians' ability to identify gaps in clinical quality measures, patient history, treatment plans, and unaddressed or worsening conditions. This means:

<p>Greater control of workflow Data Diagnostics is designed to fit into the workflow your office and clinical staff has in place so that less time is spent searching for patient data from multiple sources.</p>	<p>Greater confidence in clinical decision-making You have access to daily updated, data-driven, patient-specific insight on which to base your decisions.</p>	<p>Better informed time with patients More quality time with patients means greater ability to reduce risk factors, improve outcomes, and stay ahead of benchmarks.</p>
--	---	--

You and your office staff can access three types of patient-specific reports within their workflow:

-  **Quality-Related Analytics:** Provides a comprehensive picture of patients' current or predicted clinical and quality gap status for specific quality measurements (e.g., CMS 5-Star, ACA QRS, or NCQA/HEDIS®) and actions needed to improve quality.
-  **Historical Data-Related Analytics:** Provides insight into detailed medical history to help inform diagnosis, potentially reduce encounter time, avoid duplicative exams or tests, and aid in patient evaluation and diagnosis for more efficient and improved care.
-  **Risk Score-Related Analytics:** Provides insight into patient risk score accuracy gaps (e.g., HCC, CRG, CDPS) and supports accurate disease burden documentation of unaddressed or worsening conditions to achieve a more accurate understanding of patient-specific disease burden.

Easy to integrate, **easy to order**

Because it can be ordered within existing workflows, Data Diagnostics is as simple as ordering a traditional laboratory CBC, and the HIPAA-compliant analytical results are returned within seconds.*

*Results are delivered in real time after an order is received by Quest; turnaround time can vary from system to system. Report information is based on data contained in existing datasets.

Data Diagnostics helps improve clinical and financial performance, benefiting each part of the healthcare system for a stronger healthcare community overall.

Health plans—Seamlessly implements analytics across the provider network, helping to achieve key business goals of improving quality outcomes and metrics.

Providers—Provides real-time insights at the point of care within current workflows to enable clinicians to make more informed decisions that support improved outcomes, streamlined operations, and achieving quality metrics.

Patients—Enhances the patient encounter and the continuity of care by providing clinicians actionable insights and allowing for more quality time with patients.

Health systems—Complements healthcare initiatives for employed and affiliated physicians. Offers access to real-time information that can be easily integrated into existing operational models to help improve financial performance and quality metrics.
